

ICRI marine and polar

Peter M. Haugan

Geophysical Institute, University of Bergen, Norway

1. Technology is the main driver
2. Remote and rugged environments -> time lag
3. Distributed and fixed points in addition to ships

UNIVERSITY OF BERGEN
GEOPHYSICAL INSTITUTE

Future of ocean and atmosphere measurements

Geophysical institute

A university department with met, ocean, climate, renewable energy research and education

How can we understand the ocean?

- Remote sensing
- Research cruises
- Ships of opportunity
- Lagrangian observatories (such as Argo)
- Eulerian observatories (such as EMSO and EuroSITES)
- **gliders and new technology**

Example: Norwegian Atlantic Current Observatory (NACO) National glider observatory off the Norwegian shelf

Operation central

NACO launch, minister Tora Aasland

C.Begler

Combining section with eddy process study

Gliderpage – current vs depth profile

Fixed point observatory at shelf break @500m

Messages

- 1. Major progress in marine science has been technology driven and is expected to continue to be technology driven.*
- 2. Polar and marine environments are demanding and costly to physically access.*
- 3. It is particularly important for polar and marine science to develop and validate new measurement platforms and achieve a good combination of distributed observations and high quality fixed point time series observatories.*

European projects: FixO3/EMSO (Fixed point), Euro-Argo and GROOM (Distributed), SIOS (Integrated), EuroFleets
